Build a Website with Claude Code

A practical guide for beginners and builders

Introduction

Building a website used to mean learning HTML, CSS, JavaScript, frameworks, deployment pipelines… and spending weeks just to see something online.

Today, tools like Claude Code change the game.

You don't just *write code* anymore — you *collaborate with AI* to build faster, smarter, and with less friction.

This ebook will guide you step-by-step.

We start with the foundation:

the terminal

installing and running Claude Code

Chapter 1 — Mastering the Terminal

1.1 What is the Terminal?

The terminal (also called *command line* or *shell*) is where you talk directly to your computer using text commands.

Instead of clicking buttons, you type instructions.

It might feel intimidating at first — but it's actually:

- faster

- more precise

- essential for developers

1.2 Why the Terminal Matters

When building a website, the terminal lets you:

- create and navigate projects
- install tools and dependencies
- run development servers
- deploy your website
- interact with AI coding tools like Claude Code

If you skip the terminal, you'll always be limited.

1.3 Opening the Terminal

- Press `Cmd + Space`
- Type `Terminal`
- Hit Enter

On Linux:

- Press `Ctrl + Alt + T`

On Windows:

- Use **Windows Terminal** or **PowerShell**

1.4 Essential Commands You Must Know

Think of these as your "survival kit".

Navigate folders

```
cd my-folder
```

Move into a folder

```
cd ..
```
